

There are few things I'm going to write down here to better understand my code:

1. There are two different code segments for part 1 and part 2 so that both .csv files are created when calling the function once
2. To call the function I run it in a python terminal :

```
'''Import ass3 as a
```

```
a.free_fall()'''
```

3. Part 1 .csv is 301 for the 300 0.01 timesteps and part 2 .csv is 501 for the 500 0.01 timesteps
